

Things You Can or Can't Fix in Post: Video Acquisition

You Can Fix *Anything* in Post

If whole characters can be created (and an actor's legs atrophied) in computers, it must be possible to fix *anything* that is not live in post

Questions?

You Can Fix Anything in Post *only* with enough time & money

Acquisition Starts the Chain

- ⦿ Affects everything that follows
 - problems should be fixed there (if possible)
- ⦿ Isn't just cameras
 - lighting, lenses, filters, & even mounts play major roles
- ⦿ Affected more by operator actions than by most camera characteristics
 - lighting, lens adjustments, processor settings, etc.
- ⦿ Sharpness affected by contrast as well as resolution
 - contrast affected by diffraction and lenses

Video Acquisition: It's Not Just Cameras

lighting: *huge* effect on final image
optical filter: reduction of post, but...
lens: design, focal length, aperture, etc.
imagers: quantity, type, design, size
signal processing: many parameters
mount: image stability, camera motion

storage/distribution: no effect
(*except* money, time,
size, weight, life, labor,
labeling, reliability, audibility
and, ultimately, quality)

Most Important Acquisition Resource

operator(s)

light, position, zoom, focus, pan, tilt, filter, iris, paint, etc.

Storage

less rest?

not great for labels

not great for hand-held

Aperture in F-Stops

WGBH Public Television Quality Workshop

Getting to the Sharpness Sweet Spot

- ◉ Iris: one setting is best
- ◉ Lighting: add or subtract
- ◉ Gain
 - noise if increased
- ◉ Shutter: for larger aperture
 - also reduces motion blur
 - but introduces motion “judder”
- ◉ Neutral-density filtering
 - for larger aperture
 - possible glass flaws
 - reflection, color shift, etc.

HIGH DEFINITION TELEVISION

27. With a view to extending the application of Television to a wider field and thereby increasing its utility and entertainment value, much attention has been given in recent years to the problem of obtaining better definition and reduced "flicker" in the received pictures.

28. The degree of definition it is essential to obtain is necessarily a matter of opinion, but the evidence received and our own observations lead us to the conclusion that **it should be not less than 240 lines** per picture, with a minimum picture frequency of 25 per second. The standard which has been used extensively for experimental work

it should be not less than 240 lines

True or False?

- ⦿ Larger-format cameras offer wider angles
- ⦿ Larger-format cameras are more sensitive
- ⦿ Larger-format cameras have shallower depth of field

True or False?

- ⦿ Larger-format cameras offer wider angles
- ⦿ Larger-format cameras are more sensitive
- ⦿ Larger-format cameras have shallower depth of field

Answer: Yes

True or False?

- ⦿ Larger-format cameras offer wider angles
- ⦿ Larger-format cameras are more sensitive
- ⦿ Larger-format cameras have shallower depth of field

Answer: Yes

(the statements are both true and false)

Introducing the Format Factor

Divide equivalent factors of one format by another's.

e.g., ~~2/3-inch imager~~ 11-mm diagonal divided by 1/3-inch imager 5.6-mm diagonal yields a format factor of ~2.

- ⦿ Applies to many imaging characteristics
 - acceptance angle, sensitivity, dynamic range, depth of field, diffraction, lens MTF

Shot Size

The Format Factor affects focal lengths

◎ Acceptance Angle (shot size):

- 20 mm lens in 2/3" ~ same as 10 mm in 1/3"
- But 4.5 mm in 2/3" ~ same as **2.3** mm in 1/3",
1.8 mm in 1/4", **1.5** mm in 1/5", **1.2** mm in 1/6"

Sensitivity

The Format Factor affects sensitivity

Full output

Quarter output

Quarter output

microlenses best at high f-stops

⦿ Sensitivity (exclusive of microlens issues):

- $f/20$ in $2/3''$ ~ same as $f/10$ in $1/3''$
- But $f/2$ in $2/3''$ ~ same as $f/1.0$ in $1/3''$,
 $f/0.8$ in $1/4$ -inch, $f/0.7$ in $1/5''$, and $f/0.5$ in $1/6''$

Shallow Depth of Field

Depth of Field

(not in macro or hyperfocal regions):

- Range of distances appearing to be in focus with the lens focused at some particular distance
- Complex equations based on f -stop*, focal-length*, shooting distance, and “circle of confusion*” (circle that is visually indistinguishable from a dot)
 - * format-factor-related
- 20 mm $f/20$ in $2/3$ ” ~ same as 10 mm $f/10$ $1/3$ ”
- But 4.5 mm $f/2$ in $2/3$ ” ~ same as **2.3 mm $f/1$** $1/3$ ”, etc.

Large Format for Everything?

- Wider angles, more sensitive, shallower DOF, less diffraction, better lens performance
- Can be inexpensive
 - Panasonic, Red, Sony
 - DSLRs: *House* 2010 finale
- Larger than iPhone
- Can lack video-camera features
- Limited zoom-lens availability
- Usually CMOS
 - “rolling shutter” issue
- Usually single sensor

iPhone 4 (HD phone)

- 1/3.2-inch-format image sensor
- 2592x1936 (4:3 aspect ratio)
 - therefore 1/4.3-inch for HD video
- 3.85 mm $f/2.8$
 - 2/3" equivalent: 11 mm $f/8$
- Everpresent
- Stability?

WGBH Public Television Quality Workshop

Anything for Everything?

- Ultra HD
- Ultra high sensitivity
- High speed (slow motion)
- 3D
- Tiny
- Panoramic
- Holographic
- H-bomb proof

- Small
- Low cost

To Sum Up

- ⦿ Acquisition affects everything that follows
 - problems should be fixed there (if possible)
- ⦿ Acquisition equipment isn't just cameras
 - lighting, lenses, filters, & mounts play major roles
- ⦿ Operator actions affect pictures more than do most camera characteristics
 - lighting, lens adjustments, processor settings, etc.
- ⦿ Sharpness is affected by contrast as well as resolution
 - contrast is affected by diffraction and lenses
